Preface: the idea behind it

This plugin was built around a simple reality: most businesses—coffee shops, clubs, gyms, boutiques, niche e-commerce brands—need to **promote, retain, and organize**. You run promos to bring people in, you run loyalty to bring them back, and you run events to turn customers into a community. Too often those tools live apart, with different dashboards, different costs, and no shared language.

Coupon & Fidelity Manager brings them together in a single ecosystem, with the **QR code** as the common primitive: a unique, scannable token that ties every promise (a discount, a point, a ticket) to a person and a rule you control.

Three design choices shaped everything:

1. **Uniqueness & traceability** — every coupon or ticket is a unique, verifiable entity.

2. **Parallelism** — “Sets” run side by side, so you can have “Gelateria 10” and “Desserts 15” live at the same time with no conflicts.

3. **Ease of use** — WordPress first, with shortcodes, auto-generated pages, Elementor compatibility, and a **WhatsApp via wa.me** option that is free and doesn’t require third-party credentials.

Who this is for and when to use it

Picture a café with two product lines: **ice cream** and **pastry**. Instead of one generic coupon, the café creates **two independent Sets**—*Gelateria 10* and *Desserts 15*. Each set has its own form, expiry policy, and landing page. Customers pick what fits them, download a QR, and show it at the counter. In parallel, the café activates a **Fidelity** program on pastry so pastry lovers keep coming back. On weekends, it hosts a **tasting event** and sells or distributes tickets with the module.

No need for three different tools: everything lives in one plugin with coherent data, clean exports, and friendly verification views.

Ideas for Coupon Sets

Use Sets to segment by product line (ice cream, pastry, brunch), by audience (students, locals, VIPs), or by time window (happy hour, midweek promo). Build a “catalog” page of all active sets so customers can browse promotions and self-select.

Why Loyalty (Fidelity)

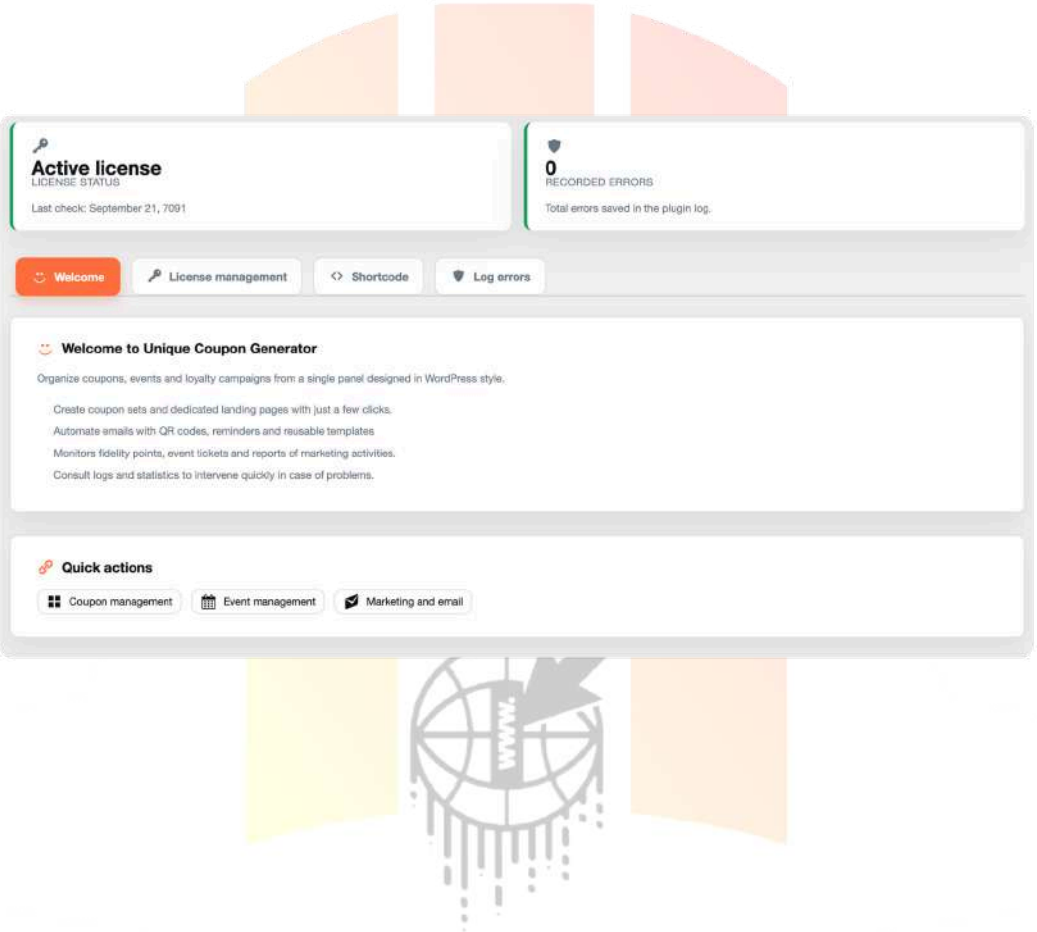
Discounts spark trials; **loyalty sustains margins**. A simple structure (e.g., 1 point/€ + a 50-point welcome bonus) builds habit. The cashier terminal makes accrual/redeem a five-second action. A transparent user panel reduces questions and disputes.

Why Events/Tickets

Events build relationships. With Ticket20 you define ticket types (base/premium/backstage), limits and pricing, choose **online checkout** (WooCommerce) or **on-site** flows, schedule a **cut-off**, associate **PRs** to measure who brings people, and send reminders to reduce no-shows.

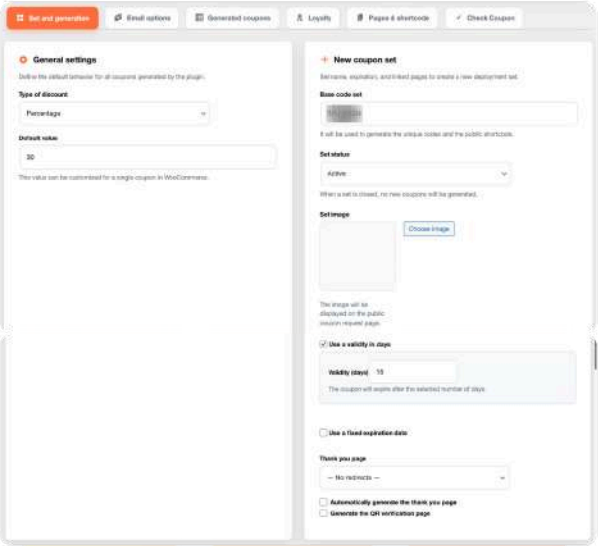
First look at the interface

After installing from **Envato Market**, you'll see a dedicated sidebar menu with everything: Set creation, Email/WhatsApp options, Events/Ticket20, views for coupons and tickets, bulk email, user registry, and error logs. The intent is that you can create your first Set right away without reading an encyclopedia.



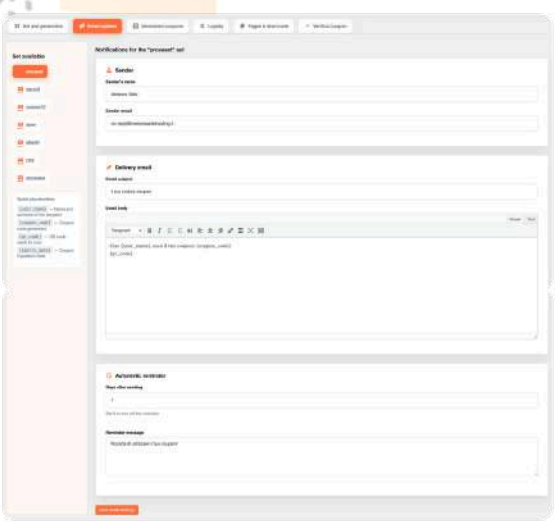
Creating your first Coupon Set (and doing it well)

A **Set** is a container of rules and content. Give it a clear name (e.g., *Gelateria 10*), choose **fixed** or **percentage** discount, set the **expiry** (either a fixed date or N days after download), and decide which **form fields** to collect (name, email, phone, city—only what you truly need).

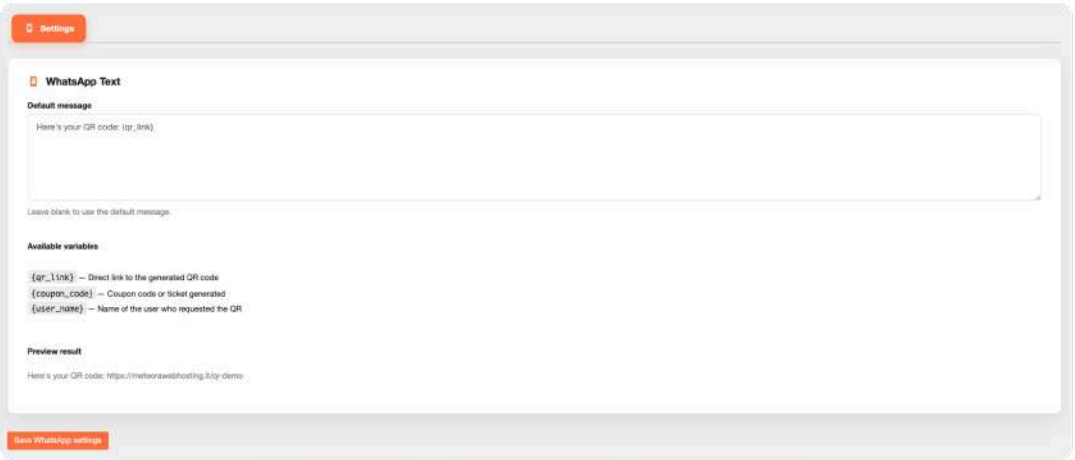


Each Set produces its own **shortcode**. You can let the plugin auto-generate a ready-to-use **landing page**, or you can drop the shortcode into your own Elementor page. Automation is for speed; Elementor is for a fully tailored experience.

Communication seals the deal. In **Email Options** you configure the sender (use a domain sender to avoid spam), subject, and body. Variables like {coupon_code}, {qr_code}, {user_name} help you personalize at scale. If your promotion benefits from a nudge, schedule a **reminder** (e.g., 7 days after download, polite tone, clear CTA).



Finally, **WhatsApp**: the form can include a checkbox “**Send me the QR via WhatsApp**.” If the customer ticks it, after submission you open a **wa.me** link with a prefilled message (no external APIs). In the backend you customize the text (e.g., “Here is your QR: {qr_link}”); the plugin replaces variables and URL-encodes it. It’s a simple, free way for customers to **self-send** the QR to a place they’ll actually check.

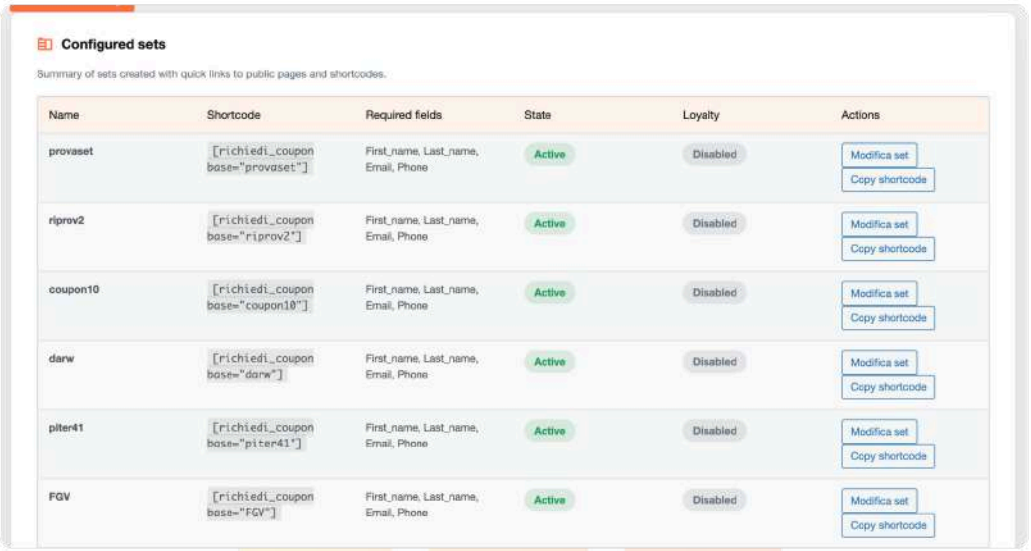


Practical tip

Resist the urge to ask for everything: **fewer fields = higher conversion**. In two lines, state the value, the validity, and what happens after submit. Put any conditions (minimum spend, time windows, exclusions) right next to the CTA.

A page that lists all Sets

Customers decide faster when they see the whole offer at a glance. Create a page that lists all active Sets—cards with title, short blurb, and a link to the Set landing. It's a compact "promo catalog" and an excellent page to advertise.



Configured sets

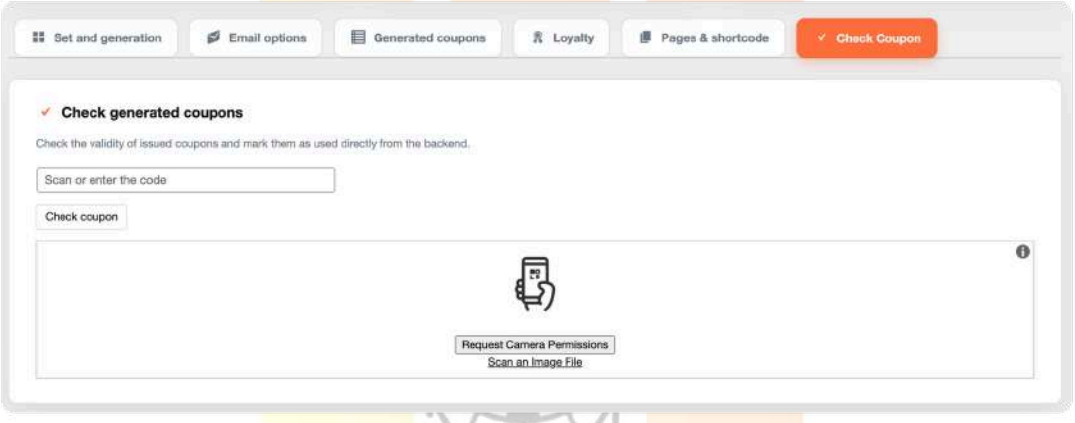
Summary of sets created with quick links to public pages and shortcodes.

Name	Shortcode	Required fields	State	Loyalty	Actions
provaset	[richiedi_coupon base="provaset"]	First_name, Last_name, Email, Phone	Active	Disabled	Modifica set / Copy shortcode
riprov2	[richiedi_coupon base="riprov2"]	First_name, Last_name, Email, Phone	Active	Disabled	Modifica set / Copy shortcode
coupon10	[richiedi_coupon base="coupon10"]	First_name, Last_name, Email, Phone	Active	Disabled	Modifica set / Copy shortcode
darw	[richiedi_coupon base="darw"]	First_name, Last_name, Email, Phone	Active	Disabled	Modifica set / Copy shortcode
piter41	[richiedi_coupon base="piter41"]	First_name, Last_name, Email, Phone	Active	Disabled	Modifica set / Copy shortcode
FGV	[richiedi_coupon base="FGV"]	First_name, Last_name, Email, Phone	Active	Disabled	Modifica set / Copy shortcode

The Fidelity program: turning discounts into habit

Loyalty flips the discount logic: it **rewards over time**. Set **points per euro** sustainably (e.g., 1 point/€), add a non-token **welcome bonus** (e.g., 50 points) so value is felt immediately, and use **round, memorable thresholds** (“100 pts = €10 off”).

The **operator terminal** handles add/redeem in a few taps; the **user panel** shows balance and history, keeping support overhead low. Consider **progress emails** (“20 pts to your next reward”) to nudge recurrence.

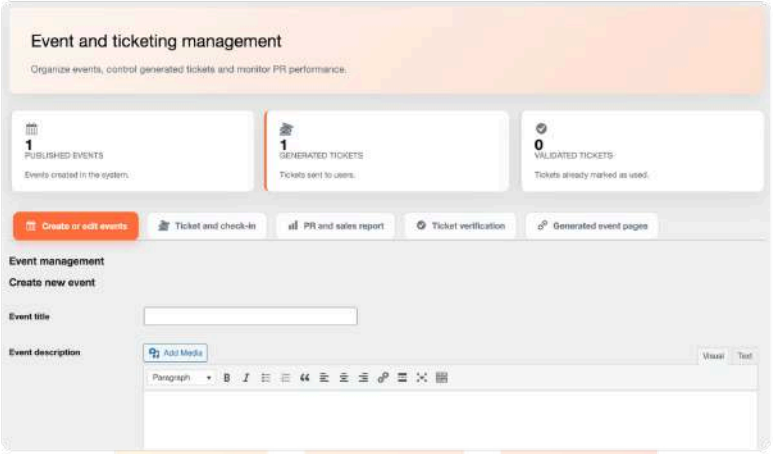


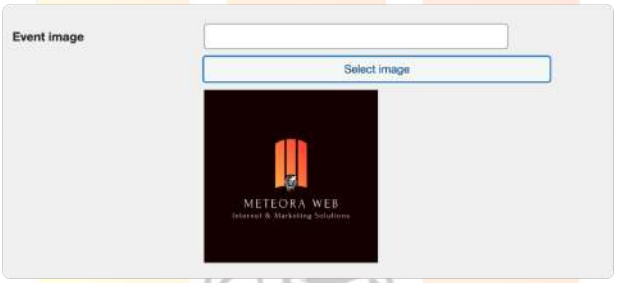
Operating advice

- Market the idea of **continuity**: people who accumulate tend to return.
- Keep the rewards model simple; complexity kills adoption.
- Place the user panel in an easily reachable mobile area of your site.

Events & Tickets: from concept to entrance

An event is a narrative project: **title, image, and description** create atmosphere; **date/time** and **venue** ground expectations; **status** controls visibility (draft while you build, published to sell, closed post-event for information). Within this frame, Ticket20 lets you define **ticket types** (base/premium/backstage), **prices**, **per-type quantities**, and a **global cap**.





For **online sales**, enable **WooCommerce**: for each ticket type the plugin links/creates a **virtual product**. On form submit we add the correct product to the **cart** and redirect to **checkout**. On **order completion** (WooCommerce hook), we generate the **QR** and send the email. It's the flow users already trust, with WooCommerce's payment guarantees.

For **on-site** flows, the ticket is issued immediately in **"to pay"** state. This is where **PRs** shine: using the dedicated [ticket_pr] page (simple login), a PR who collects payment ahead of time looks up/scans the **ticket_code** and marks it **paid**. At the door, staff can see that status and move faster.

The **cut-off** matters: set a date/time after which the form **closes**. This avoids late chaos and gives your team breathing room. Show a considerate message such as:

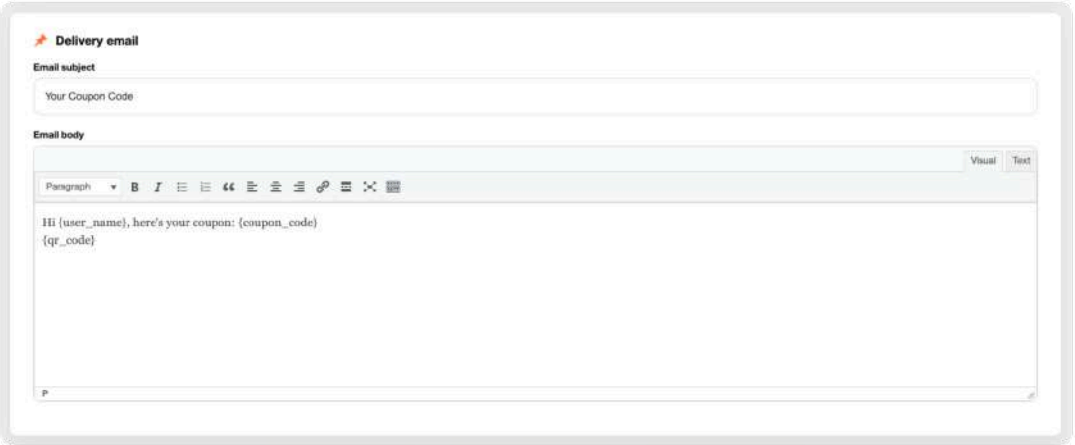
“Ticket issuance time has elapsed or tickets are no longer available. Please contact support or the event organizer.”

Operational ideas

- Make **premium** concrete and visible (skip-the-line, welcome drink, reserved area).
- Treat **PRs** like partners: share mini leaderboards and targeted comms.
- Use **reminders** 3 days before + 3 hours before—short, logistics-oriented (time, entrance, what to bring).

Communicating well: Email and WhatsApp (free, no APIs)

Email remains the most controllable channel: use a **domain sender** (e.g., no-reply@yourdomain.com) and set up SPF/DKIM/DMARC to stay out of spam. Personalize with {user_name}; prefer {qr_link} over attachments for mobile readers; include {event_date}, {event_time}, and {venue} to reduce back-and-forth.



WhatsApp here is a **bridge**. The form includes a “Send me the QR via WhatsApp” checkbox. If selected, you open a **wa.me** link with a prefilled message—text you define in the backend. This is **not auto-sending**; the customer taps “Send” in their WhatsApp. The upside is huge: no APIs, no tokens, no extra cost, and extremely familiar UX.

Suggested copy

> “Here is your QR: {qr_link}. See you on {event_date} at {event_time} in {venue}. Please show it at the entrance.✨”

Pages, shortcodes, and Elementor: building the experience

The plugin works perfectly **without** a page builder thanks to **shortcodes**. If you want full design control, Elementor is a natural fit: drag the **Shortcode widget**, paste the code for your Set or Event, and compose around it.

Key shortcodes

[richiedi_coupon base="SETNAME"] — Set request form

[richiedi_ticket base="EVENT_ID"] — ticketing form

[verifica_coupon] — public validation page

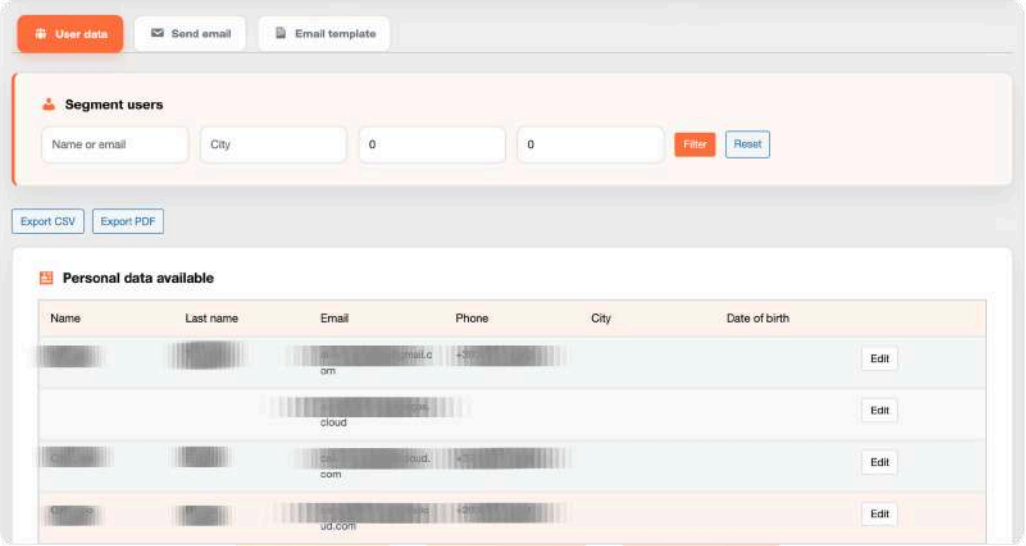
[ticket_pr] — PR page to mark “to pay” → “paid”

[ucg_fidelity_terminal] / [ucg_fidelity_points] — operator terminal / user balance

When the plugin **auto-creates** pages (landing, validation), it uses an **anti-duplication** guard. If you delete an auto-created page and need to regenerate it, do so via the dedicated settings to keep database references tidy.

Reading data, doing marketing, exporting cleanly

The **View** sections (coupons/tickets) are your dashboard. Filter by Set or Event, date range, status (paid/unpaid/used), city, and **PR**. Don't just "count"—**interpret** which Sets convert, when, and with which copy.



When you're ready to act, use **Bulk Email** for targeted campaigns: "last day for backstage," "thank you—here are 20 bonus points," "new gelato flavors this weekend." **Export CSV/PDF** to feed your CRM or build management reports.

Verification & day-of operations

Verification exists both as a **public page** and an **admin tab**. The public page helps customers self-check; the admin tab helps staff validate at the counter or gate. Tickets follow a clear lifecycle: **to-pay** → **paid** → **used**. Coupons have their own states (valid/expired/used) consistent with Set rules.

Privacy, consent & compliance

A **privacy consent checkbox** is mandatory and should link to your policy page. Collect only what you need for the stated purpose; retain reasonably; export/erase on request. The plugin respects WordPress/GDPR mechanisms. For email deliverability, configure domain DNS (SPF/DKIM/DMARC) and keep content balanced.

Operating safely (guard rails that matter)

We built in **guard rails**: anti-duplication for auto pages, **single-record** queries on code/QR checks to avoid loops, consistent state transitions. Follow best practices: do not write data during **shortcode render**, use **virtual products** for WooCommerce tickets, redirect to checkout **after** adding to cart, and schedule heavy sends for off-peak times.

Before big events, **back up** (DB + QR assets) and consider a slightly earlier **cut-off** to create margin. If anything seems to repeat (e.g., a page re-creating), ensure no hot hook runs without an “already exists” check.

Frequently Asked Questions (curated)

Can I use the plugin without Elementor? Yes. Shortcodes are enough. Elementor is for richer visual compositions.

Is it compatible with WooCommerce? Yes—for tickets sold online. Cart → checkout → order complete → ticket/QR.

Can I disable reminders? Yes: use a very large number (e.g., 9,999,999 days) where you want “never”.

Is the WhatsApp message automatic? No. We open a wa.me link with prefilled text; the user sends from their device. It’s the free, universal route.

Can PRs mark “used”? No. Their page is for **to-pay** → **paid**. “Used” is typically handled by door staff or admin verification tools.

Quick appendix (only what’s actually useful)

Variables: {coupon_code}, {qr_code}, {qr_link}, {user_name}, {event_date}, {event_time}, {venue}.

Shortcodes: [richiedi_coupon base="SETNAME"], [richiedi_ticket base="EVENT_ID"], [verifica_coupon], [ticket_pr], [ucg_fidelity_terminal], [ucg_fidelity_points].

WhatsApp: phone in international format **without “+”**, message **URL-encoded**; link is https://wa.me/{prefix}{phone}?text={message}.

Conclusion

Coupon & Fidelity Manager isn’t “a QR plugin.” It’s a **toolkit** to bring people in, bring them back, and host moments that matter. It’s simple enough to launch in an hour and complete enough to scale with you: parallel Sets, clear rules, reliable payments, useful reports, and communication that meets customers where they are—email and WhatsApp. The technology is ready; the difference is your clarity: **clean ideas, low friction, human messages**.
